Abstract: The primary objectives of this study was to evaluate quality of wood pellets which was produced in 5 provinces across Canada, by 8 major pellet producers. Quality was evaluated according to PFI and EN-14961-2 standards. All test were provided in accordance with ASTM standards. Almost all samples match EU and American standards with minor expectations.

Introduction

- Canada is one of the leading countries in wood pellet production
- There are 39 operational pellet plants in Canada[1]
- Installed capacity in 2011 was 3.22 mil. tones[1]
- Export is around 90% (mainly to EU)[2,3]
- **No national standard for wood pellets**

Materials

- 8 different pellet producers
- 5 Canadian provinces (ON, MB, BC, NS, QC)
- 9 parameters were tested
- Pellet Fuel Institute(PFI standard) and EN 14961-2 (pan-European standard)

Methods

- Bulk density measured according to ASTM E 873-82.
- Durability and fines amount according CEN/TS 15210-1.
- Moisture content according ASTM E 871-82
- Proximate analysis was provided according to ASTM 870-06
- Calorific value according ASTM E711-87
- Single pellet density defined using the hydrostatic method

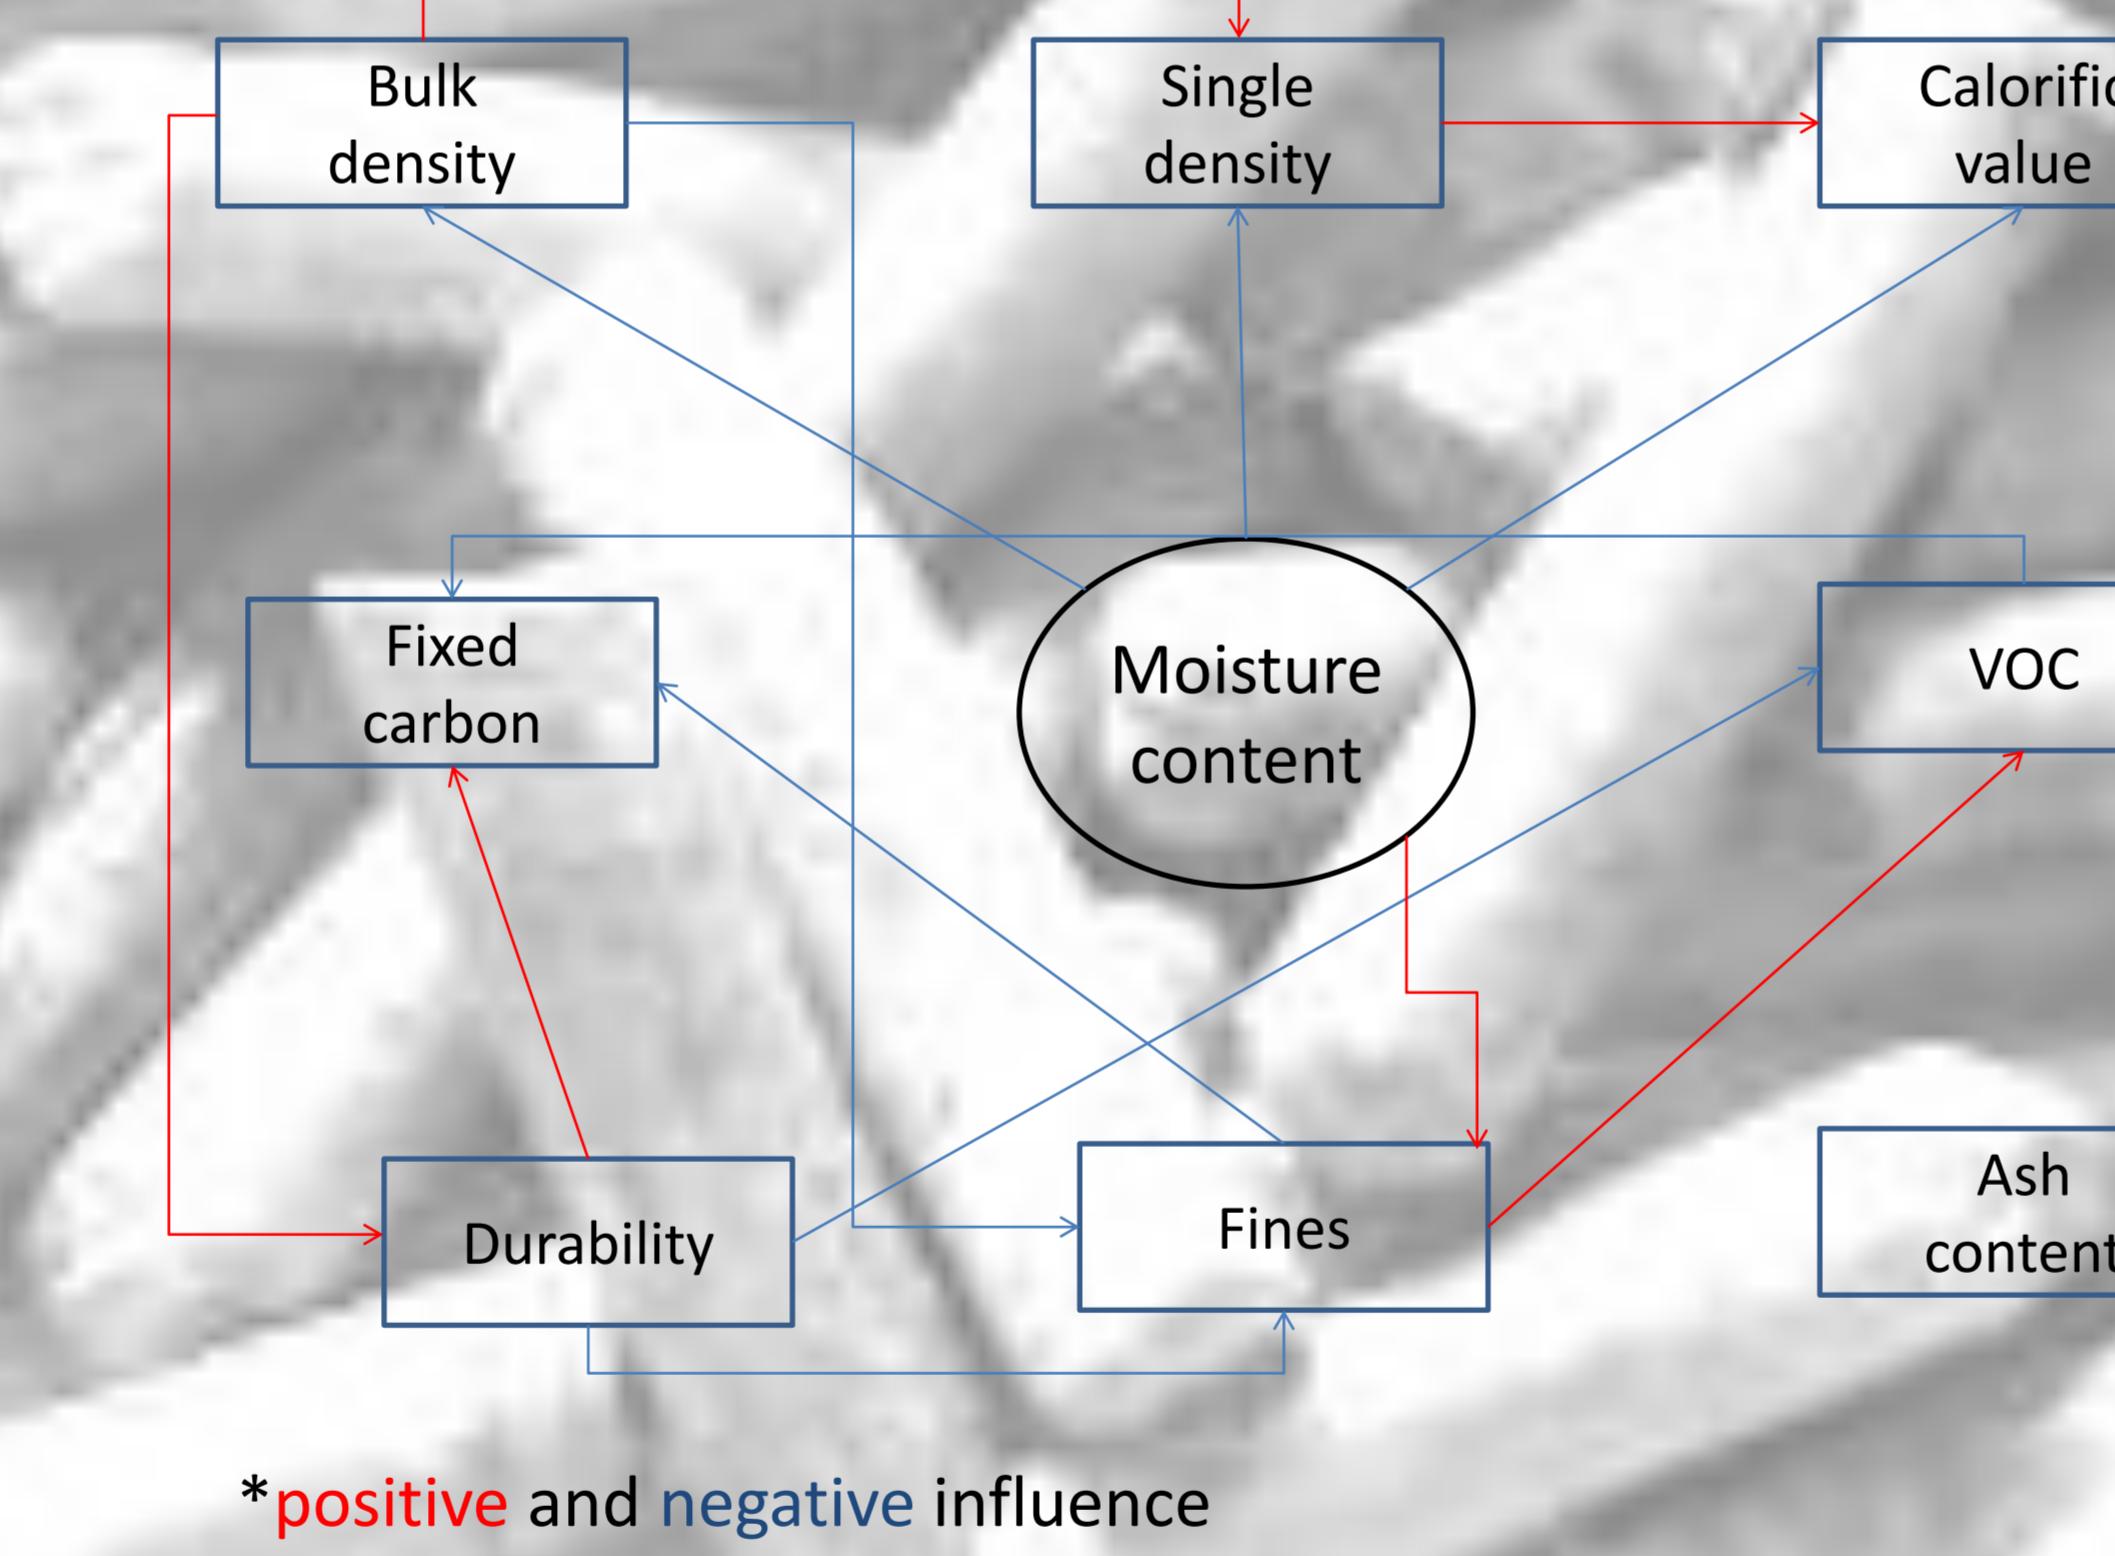

Results

No	Bulk density (kg/m³)	MC (%)	Durability (%)	Fines (%)	Single density (kg/m³)	Calorific value (MJ/kg)	voc (%)	Fixed Carbon (%)	Ash (%)
1	701.3	4.44	97.6648	0.0635	1249.884	20.5425	84.995	14.55	0.4568

Parameters interdependence

Results and discussion

Results and discussion

Conclusion

- ✓ Average values of all parameters match European and American standards
- ✓ Strong positive correlation of VOC with fines amount
- ✓ Fixed carbon is acting as an adhesive
- ✓ Two samples doesn't match the EU-standard standard by durability
- ✓ One sample doesn't match both standards by ash content.
